GENERAL

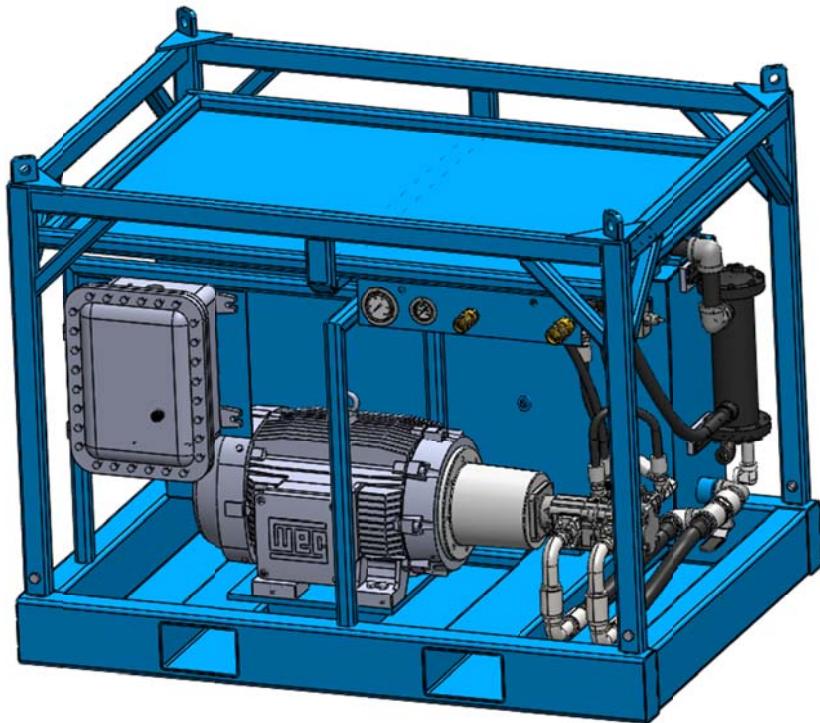

Figure 1: Power unit

Texas International Oilfield Tools (TIOT) offers a Power Unit which operates many types of hydraulic equipment. The unit is mounted on a skid for easy transport.

Large forces are involved in using this device. Operate this equipment with extreme caution

CONVENTIONS

IMPORTANT SYMBOL IDENTIFICATION	
	WARNING to Operators / Users
	CAUTION to Operators / Users
	NOTIFICATION to Operators / Users

Table 1

SAFETY

Texas International's equipment is used and installed in controlled rig environments involving hazardous operations and situations.

All personnel performing installation, operations, repair or maintenance on this Power Unit must have knowledge of rig procedure. All crew in the vicinity of operations should be trained on rig safety and tool operation.

SPECIFICATIONS

Do not exceed the system's rated pressure or over tighten fittings

INSTALLATION

- 1) Find the best location
- 2) place the unit, connect power, and make hydraulic connections
- 3) test the unit for proper operation

The electrohydraulic power unit requires a source of line or rig power capable of delivering the voltage and amperage needed.

Always ensure the unit is properly grounded

It's important to consider electric and hydraulic line losses from size, length and pressure (hydraulic) in choosing where to place the unit. The sizes of the hydraulic lines should be large enough to limit friction losses to 300 psi or less. This may mean using hoses larger than the connections on the unit. For connection instructions, see Hydraulic section page 10.

Proper hose connection is required to fully open the check valves in the hose couplings

The presence of hazardous locations should be compared with the rating of the power unit for compatibility. Ideally, the unit will be located as close as possible to the electrical power source and the equipment to be powered. Ensure power cables are placed where they won't be cut, nicked, or squeezed.

! The motor develops almost 300 foot-pounds (ft/lb) of torque while running, 485 ft/lb with the rotor locked and foreign objects (i.e. loose clothing, long hair, etc.), can be drawn in - with disastrous results

! **NOTE** Main breaker must be off and "locked out" until all wiring and wiring inspection is done. Wiring must be performed by a qualified, licensed electrician

When properly connected, the motor rotates clockwise when looking from the pump towards the motor.

! Replace the cover on the pump to motor coupling housing once rotation is verified

Transport the power unit using **only** the forklift tubes provided shown in Figure 2.

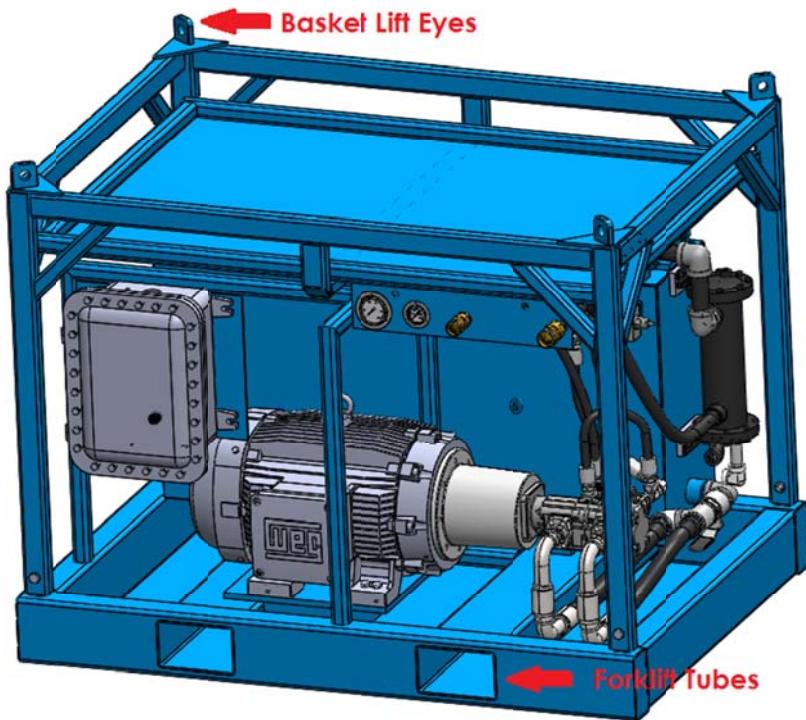

Figure 2

Use the top lift eyes to remove the top basket from the frame/skid - NOT designed for lifting entire skid

If the unit is full of hydraulic oil the center of mass is approximately in the center of the forklift tubes. If the unit is empty, the center of mass is still between the forklift tubes but biased to the motor end.

Positioning forklift forks in other positions can damage the unit and can be dangerous to personnel

Ensure the unit does not shift or move from its intended location.

HYDRAULIC

The power unit during operation heats the hydraulic fluid. If the reservoir temperature exceeds 150 degrees Fahrenheit (F), shut down the unit and let it cool. If this happens regularly, have unit repaired.

Be careful not to expose skin to hot hydraulic fluid – it can scald

Time and Temperature Relationship to Severe Burns

Water temperature	Time for a third degree burn to occur
155° F	68° C
148° F	64° C
140° F	60° C
133° F	56° C
127° F	52° C
124° F	51° C
120° F	48°C
100° F	37° C

Figure 3*

*American Burn Association SCALD INJURY PREVENTION, Educator's Guide

The hydraulic fluid may be under pressures as high as 2500 psi. Fluid can be sprayed some distance, creating a slip hazard. If a leak occurs, shut down the power unit

immediately and repair. Hydraulic fluid can irritate the skin – for skin contact, wash and rinse the affected area. If fluid comes in eye contact, use an emergency eyewash or flush with saline solution. If not available, flush with distilled or lastly, tap water. Seek medical attention after flushing.

 Avoid the hydraulic fluid spray– it can be injected through the skin at high pressures

The power unit is equipped with Snaptite 78 series quick disconnect couplings (or equivalent), one (1) inch for the supply line and one and a quarter (1-1/4) inch for the return line. These couplings contain check valves to prevent the loss of hydraulic oil during connection and disconnection.

 Proper connection is required to fully open the check valves in the couplings

Connect the hoses as follows:

1. Wipe the connections clean as required to remove dirt and dust
2. Connect the one (1) inch pressure hose to the one (1) inch coupling on the unit by engaging the mating coupling halves and forcing the connectors together while rotating the threaded sleeve on the hose connector
3. Using the same method as for the one (1) inch hose, connect the one and a quarter (1-1/4) inch return hose

 The motor and pump must be off (locked out) before connecting hoses

 If either the pressure or return fittings are not fully tightened, the check valve will cause a restriction in the flow. This can result in overheating the fluid, poor tool operation and damage to equipment

Hoses, connections and fittings should be chosen carefully so as not to cause excessive restriction. Restriction in a hydraulic system equals pressure drop and pressure drop equals heat. Improper connection or restrictive circuits can cause a serious loss of power and will generate heat uselessly. Choose short, large inside diameter hoses whenever possible over long, skinny ones.

Hydraulic continued

High temperatures decrease the useful life of the hydraulic oil, the hoses and the seals in the equipment being powered

Low hydraulic fluid level can cause overheating, or in worst cases severe damage to the pump and even the associated tools it's driving. Keep fluid up to at least the minimum on the sight gauge. Observe the filtration monitor to be sure it's operating in the green (OK) range. Change the filter if it's not.

Table 14

OPERATION

On the power unit, an electric motor drives a dual stage pump at a setting of 1500 rpm (50 hertz (hz)) or 1800 rpm (60 hz). The pump draws hydraulic fluid from the tank and delivers hydraulic fluid up to 2500 psi on the pressure line, adjustable at the unloader valve (preset at 1000 psi). The pump delivers 66 GPM at 50 hz and 79.5 GPM at 60 hz. As the line pressure decreases to 1000 psi, volume decreases to 31 or 37.5 GPM (depending on frequency). The higher volume stage of the pump is literally “unloaded” at 1000 psi, simply transferring its volume from the tank directly back to the tank through the return full flow filter with only a few psi pressure. The lower volume stage of the pump is always supplying fluid to either the output disconnect or the relief valve at system pressure. The relief valve has a maximum (factory) setting of 2500 psi. The 2500 psi setting is the maximum recommended output pressure for the standard pump. Theoretically the unit could produce 2971 psi at full motor rated output, but pump life will be shortened, possibly dramatically. See the Adjustment section on page 14 for how to change these setting.

The unit is slightly overpowered for long service life. Exceeding the factory set pressures is not recommended

For startup and shut down:

- 1) Push the START button on the main enclosure or on the remote start/stop switch
- 2) To turn the unit off, press in the STOP button

Figure 5

Operation continued

If the power unit shuts down prematurely, press the RESET button on the main enclosure. If this happens repeatedly, an abnormal condition exists which must be found and fixed before continuing operation

Cooling is provided on the return line with a two pass oil to water cooler (item 20 on Figure 7). The cooler is capable of removing nearly the entire horsepower rating in heat, keeping hydraulic temperatures low for safety and for system longevity and is easily achieved with a reasonable flow of cooling water. Controlling the temperature is done by manually adjusting the flow of the cooling water source while observing the thermometer.

Full filtration is equipped on the return line. The filter (item 7 on Figure 7) is mounted on the top of the tank and has a filter condition indicator mounted on the side of the filter housing. The condition indicator shows when the filter is operating properly, is bypassing (dirty filter), or is missing. Keeping the filter in good condition is strongly recommended, as dirt in the system will increase wear in the pump, valves and connected tools or other hydraulic tools.

Hoses and fittings have JIC swivel connections, SAE flange connections, or NPT connections. A shutoff valve (Figure 7, item 12) is on the tank so it can be drained and serviced.

ADJUSTMENTS

The relief valve adjustment is shown in Figure 12 - item 13. Turning the adjustment screw clockwise (in) raises the relief pressure and turning it counterclockwise lowers the relief pressure. Tools required: 5/32" Allen wrench (screw) and 9/16" wrench (locknut).

Adjustments should be made with the oil at normal operating temperature of 80 to 130 degrees F

The relief valve setting can be determined by running the unit with no equipment connected to the quick disconnects and observing the pressure reading on the panel gauge.

Do not operate the unit with equipment disconnected for over five (5) minutes.
Keep temperature at or below 130 degree F

Adjusting the unloader valve (shown in Figure 7 - item 6) requires equipment NOT supplied with the power unit (a flow meter (sample shown in Figure 6), JIC plugs, caps and reducers listed below). Changing the setting from the factory setpoint of 1000 psi is not recommended. The adjustment procedure to follow is given in case of field emergency.

1. Back off the relief valve so the relief pressure is well below 1000 psi. As low as it can go is good
2. Shut down the system
3. Disconnect the high volume pump hoses to the relief valve and to the pressure outlet and plug the hoses with one (1) inch JIC plugs
4. Cap one (1) JIC outlet on the high volume pump with a one (1) inch JIC cap
5. Attach the one (1) inch to three eighth (3/8) inch JIC reducer to the other high volume pump outlet
6. Connect the gauge hose and the gauge, connecting them to the one (1) inch to the three eighth (3/8) inch JIC reducer
7. Reduce the setting on the unloader valve to minimum by turning knob counterclockwise
8. Start the system

Watch for plugged hoses – they might move

9. Adjust the unloader valve to show 1000 psi pressure on the gauge
10. Stop the system, removing all plugs, caps and test equipment and reconnect the hoses
11. Start the system and set the relief valve for 2500 psi

Figure 6

PREVENTIVE MAINTENANCE

 This is a suggested PM schedule. The tool owner has the responsibility to adjust the program according to actual tool usage

 For hydraulic units, disconnect lines and drain system's pressure before maintenance

Verify that the equipment to be operated is properly connected to the power unit as specified in the Hydraulic section on page 10. Be sure the equipment being operated is an 'open center' hydraulic circuit – meaning that in the neutral position the circuit has full flow from the inlet to the outlet. If not, a 'closed center' adapter must be installed.

Cracks or the appearance of damage on the hydraulic hoses or electrical cabling can indicate the need for repair, even impending failure, and requires prompt attention.

Daily – While in use

- Verify power unit is in a secure and safe location
- Inspect the hydraulic hoses for worn or scraped areas, bubbles, wrinkles or any other wear – if found, replace
- Verify power cables and hydraulic hoses are not a trip hazard and can't be pinched or cut
- Check for exposed wires/breaks in the insulation and that electrical connections are secure
- Notice the hydraulic level and ensure tank is filled to the proper level

 Most items in the unit are lubricated by the hydraulic fluid and don't require other lubrication other than to ensure the hydraulic fluid is clean

- Verify the cooling water supply is connected and flowing

 Oil temperature will increase 80 degrees Fahrenheit in 20 minutes without water flow

- Ensure the shutoff valve to the pump inlet is fully open
- Keep the power unit exterior clean of oil, dust, dirt, water or chemicals
- Once operating, check the return filter state

Quarterly

- Replace return filter or earlier if the filter's indicator gauge shows a dirty element (before needle is in the red)
- Change the hydraulic fluid every three (3) to six (6) months – see recommended fluid on Table 13

Yearly

- Apply Mobil Polyrex® EM grease (see Appendix A) to grease fittings on motor every 9000 hours

TROUBLESHOOTING

Failure Mode	Possible Cause	Possible Solution
Pump excessively noisy	Pump inlet flow	Ensure that nothing in tank blocks tank outlet Verify suction shutoff valve is wide open
	Oil viscosity is too high	Change oil to a lower ISO VG grade
	Air	Pour oil over suction side fitting - if noise stops, disassemble, retape and reassemble
	Pump rotation is wrong	Shut down and change electrical hookup. Verify rotation is counterclockwise - looking from the motor to the pump
	Loose or worn parts	Verify assembly is tight - replace worn out parts
	Cooling water - insufficient	Verify water flow rate is at least 16 GPM
Hydraulic system overheating	Relief valve setting	Reset to a maximum of 2500 psi
	Fittings loose	Verify fittings fully tightened
	Oil viscosity	Change oil
	Excessive internal leakage	Check parts for wear - replace/repair
		Check for contamination
	Excess friction	Look at moving parts inside pump for proper fit
	Leaks in pump	Repair/replace valves
Excessive wear of moving parts	Oil contaminated	Change oil. Replace filter element. Clean breather
	Motor to pump alignment	Verify fastener tightness. If OK, replace motor to pump housing and coupling
	Relief valve setting	Reset to a maximum of 2500 psi
	Air	Pour oil over suction side fitting - if oil disappears, disassemble, retape and reassemble
	Oil viscosity is too low	Change oil to a higher ISO VG grade

Table 15

Troubleshooting continued

Failure Mode	Possible Cause	Possible Solution
Flow rate (tool speed) is low	Pump inlet flow	Ensure that nothing in tank blocks tank outlet Verify suction shutoff valve is wide open
	Pump	Inspect parts and replace as necessary
	Oil is bypassing	Check relief and unloader valves - reset
	Fittings	Confirm fittings are tight
	Oil viscosity	Change oil to a proper ISO VG grade
	Hoses	Use shorter or larger hoses
	Motor speed is low	See 'motor runs and then slows/stops' to follow
Hot or noisy operation	Misalignment	See 'motor vibrates' to follow
	Grease	Insufficient Lubricate per APPENDIX A
		Deterioration Remove old and lubricate per APPENDIX A
		Excess Reduce quantity of grease
	Motor loose	Check mounting bolts are tight
Motor will not start	Electrical Connections	Verify wiring connections/tighten
		Check voltage/amperage/phase
	Relays tripped	Allow at least five (5) minutes cooling time, then push the reset button followed by the start button
	Starter heater/relay	Replace
	Start button damaged	Replace
	Starter coil damaged	Replace
	Short circuited stator	Rewind motor
Motor stalls	Motor overloaded	Adjust or replace hydraulic valves
	Electrical Connections	Check for open phase
	Low motor voltage	Adjust or replace hydraulic valves
	Open circuit	Verify voltage at motor
Motor runs and then slows/stops	Overload	Check fuses, overload relay, stator and switches
	Power failure	Verify wiring connections/tighten
Motor overheats	Overload	Adjust or replace hydraulic valves
Motor overheats while under load	Motor vents clogged	Check vents - remove cover and clean as necessary
	Motor connections	Verify all three (3) phases have equal voltage
	Enclosure terminals	Verify all three (3) phases have equal voltage
Motor vibrates after corrections	Pump mounting housing bolts	Tighten
	Motor connections	Verify all three (3) phases have equal voltage
	Coupling damaged	Remove and examine coupling, replace if needed
Wrong Rotation	Phases not correct	Reverse any two connections at the contactor
Unbalanced line current	Unequal terminal voltage	Verify leads and connections
	Single phase	Check for open contacts
Motor does not accelerate properly	Low motor voltage	Verify voltage at motor
	Overload	Adjust or replace hydraulic valves

Table 15 continued

STORAGE AND TRANSPORTATION

- Unpainted surfaces should be coated with rust preventing agent
- Prevent excessive exposure to water and moisture
- Clean the tool after use - steam clean as needed; remove mud, debris and any other substances
- For long term storage, depressurize the system and flush hydraulic fluid

PL FACTOR

Each section of a multiple pump or motor should be regarded as a single unit with corresponding delivery and power input requirements. Since the entire input horsepower is fed through a common drive shaft, the power delivered to or from the unit is limited by the physical strength of the shaft. This limit is defined as a "PL" factor; "P" being the operating pressure and "L" the summation of gear widths.

In multiple units the "PL" must be calculated for the first connecting shaft as well as the drive shaft. Each style or type of shaft has a unique "PL" factor as noted in the table below.

Pressure X Total Gear Width = PL
PL MUST NOT EXCEED NUMBER SHOWN IN
CHART FOR APPROPRIATE SHAFT.

NOTES

1. Dimension will vary with shaft type
2. Dimension + gear width
3. Dimension is for Type 1 SEC. For Type 2: subtract 1.12" (28.4 mm) for 30/31; subtract 1.00" (25.4 mm) for 50/51.
4. Dimension + total gear width
5. Dimension will vary with port type. Subtract 0.25" (6.4 mm) for S.F. ports.
6. For 2.25" and 2.50" gear width in 50/51 series, dimension is 6.75" (171.5 mm).
7. Dimension is for wide B-C. Narrow B-C dimensions: 5.00" (127 mm) for 30/31 and 50/51; 7.19" (182.6 mm) for 75/76.
8. Dimension + 1/2 front section gear width

Piggyback Port End - Pump Only

Type 30-30, 31-31 (double 30-30 only)	KO	LO	MO
---------------------------------------	----	----	----

For All Units

To determine direction of shaft rotation, view the unit with the shaft pointing toward you, and the idler (driven) gear beneath the shaft. With clockwise rotation, flow will be left to right. The pump inlet port will be on the left, outlet on the right. The flow is in the opposite direction with counter-clockwise rotation. Inverting the pump will reverse the inlet and outlet ports but not the direction of rotation.

APPENDIX C

Gear Housing (6)

NOTES

NOTES
Shaded cells are acceptable for motor codes.

* This porting is acceptable for low pressure inlet port only.

NPT ports are not recommended for use at pressures in excess of 1500 PSI.

"X" Means both codes are available.

"2000" or "2500" indicates maximum pressure rating on port.

APPENDIX C

NOTES

NPT ports are not recommended for use at pressures in excess of 1500 PSI.

Shaded cells are acceptable for motor codes.

* This porting is acceptable for low pressure inlet port only.

"X" Means both codes are available.

"2000" or "2500" indicates maximum pressure rating on port.

Piggyback Port End - Pump Only

Type 75-50, 76-51 & 75-30, 76-31 KO LO MO

For All Units

To determine direction of shaft rotation, view the unit with the shaft pointing toward you, and the idler (driven) gear beneath the shaft. With clockwise rotation, flow will be left to right. The inlet pump port will be on the left, outlet on the right. The flow is in the opposite direction with counter-clockwise rotation. Inverting the pump will reverse the inlet and outlet ports but not the direction of rotation.

NOTES

Shaded cells are acceptable for motor codes.

* This porting is acceptable for low pressure inlet port only.

"X" Means both codes are available.

"2000" or "2500" indicates maximum pressure rating on port.

Gear Width (7)

Moduflow™ *Plus* Series

ILP and RFP Low Pressure Filters

Low Pressure Filters

Moduflow™ Plus Series

Applications for Moduflow Filters

- Power Unit Fabrication
- Off-line Filter Loops
- Mobile Equipment

The Moduflow filter is widely considered the most versatile filter available on the market. The unique diverter valve assembly, and inside to outside flow through the element, allows the Moduflow to be configured for in-line, in-tank or suction filtration.

The flow diverter minimizes turbulence and pressure loss through the filter, improving system performance.

The newly designed closed bottom elements for the RFP and ILP models insures all contamination remains trapped within the element as the filter is serviced.

A wide variety of visual and electrical indicators allows you to know exactly when the element needs to be serviced. There is even a "no element" indicator that can sense when there is not an element installed in the filter.

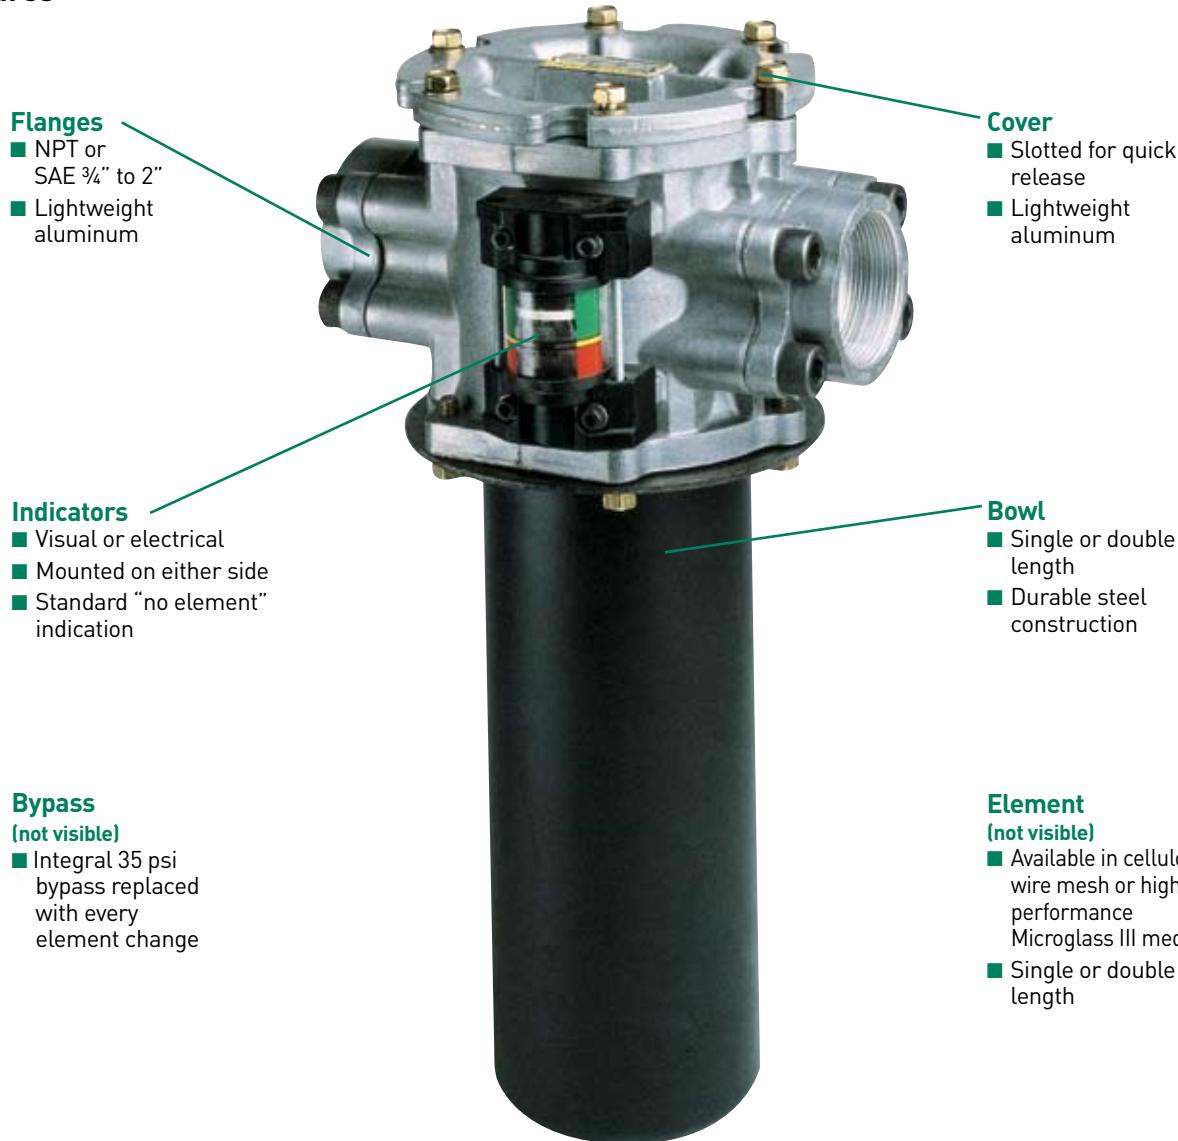

From top to bottom, the Moduflow filter series provides the high level of filtration and long term dependability so vital to today's hydraulic systems.

Parker's new patented Moduflow element was designed with built-in diverter cone and bypass valve, to meet your application needs.

Mounting / Porting Styles	
RFP Return Filter	ILP In-Line Filter

Features

Bypass

(not visible)

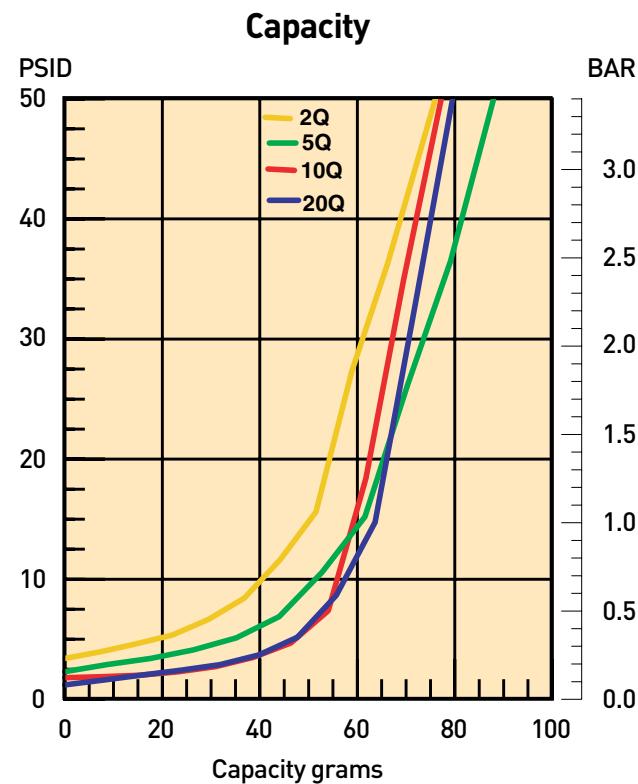

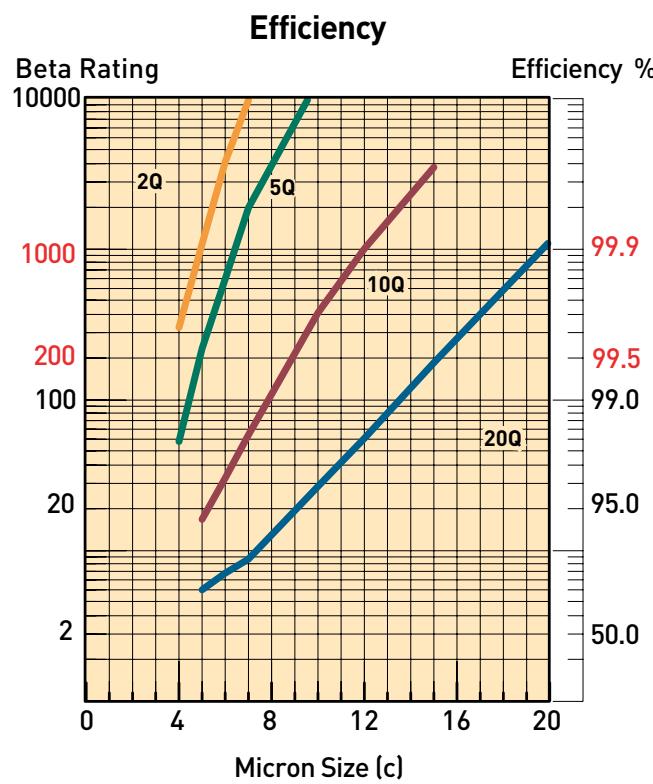

- Integral 35 psi bypass replaced with every element change

Element

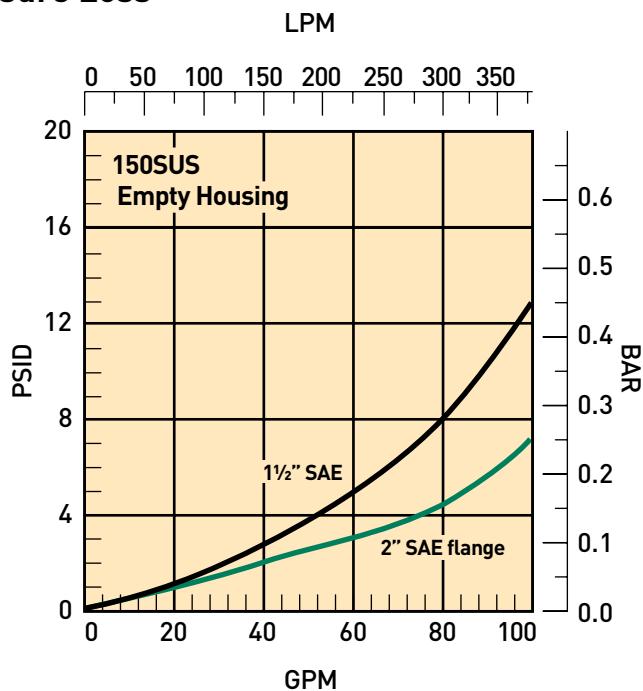

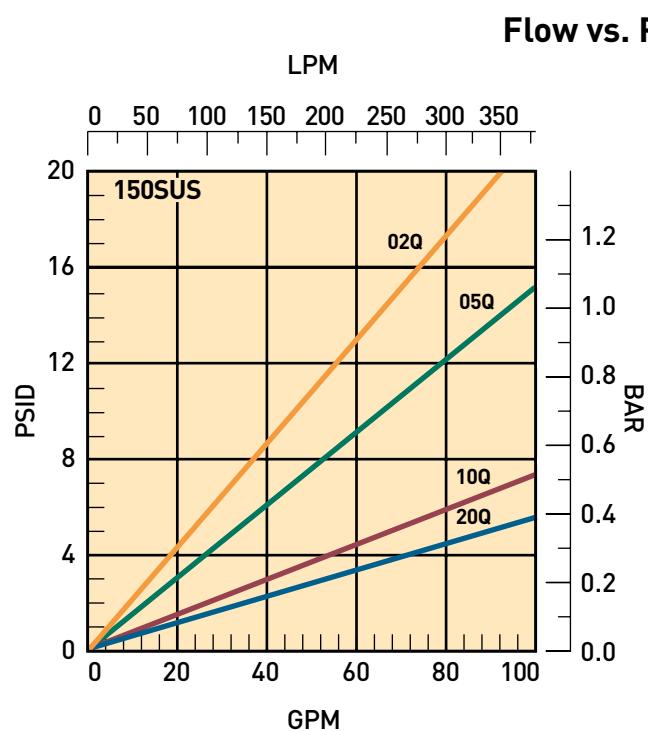

(not visible)

- Available in cellulose, wire mesh or high performance Microglass III media
- Single or double length

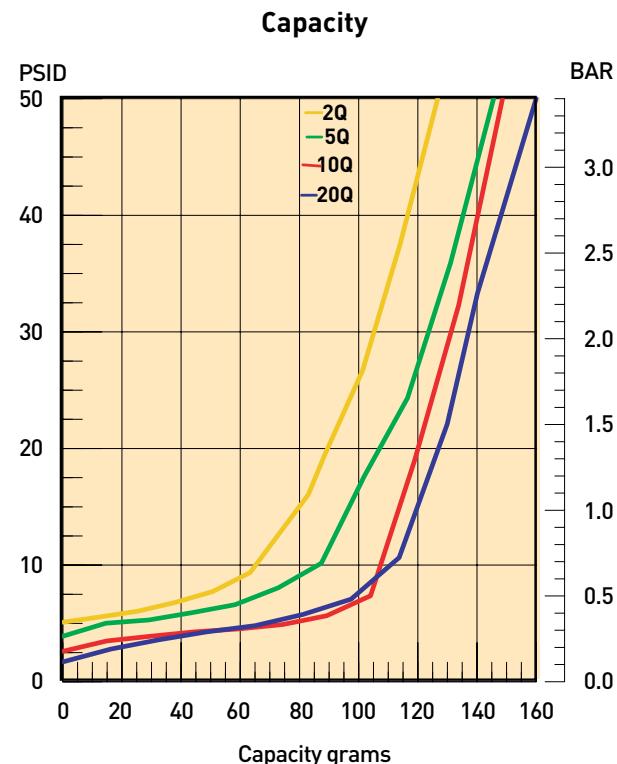

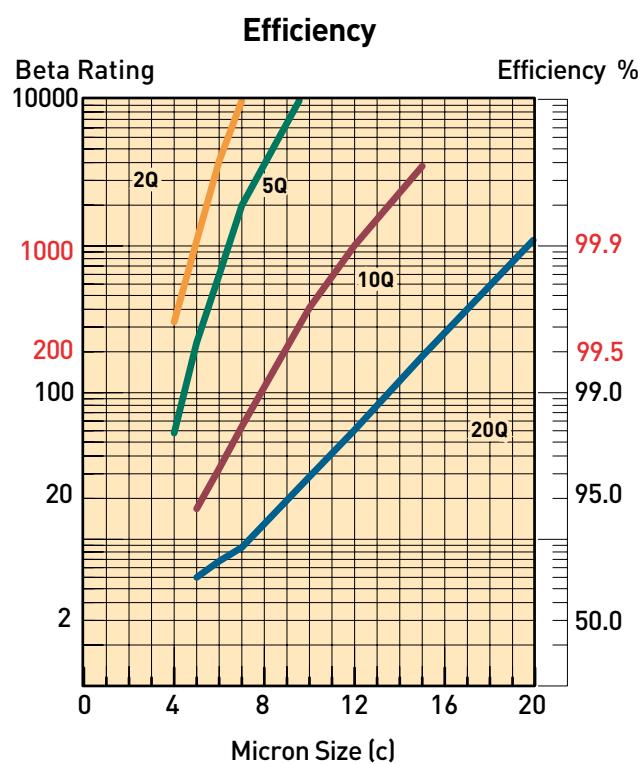

Feature	Advantage	Benefit
• Top access element service	• Oil remains in housing • Quicker elements change	• No Spills • Reduced maintenance costs
• Slotted cover	• Quick release cover • Cap screws remain in housing	• Reduced maintenance costs • No loose parts to lose
• Closed bottom elements	• Removes all contaminant during element service	• No downtime contamination from servicing
• Visual or electrical indicators	• Know exactly when to service elements	• Helps prevent bypass condition • No premature disposal
• Flange face ports	• Flexible mounting (3/4" to 2")	• Easy plumbing to your system

Low Pressure FiltersModuflow™ *Plus* Series**RFP-1 & ILP-1 Element Performance**

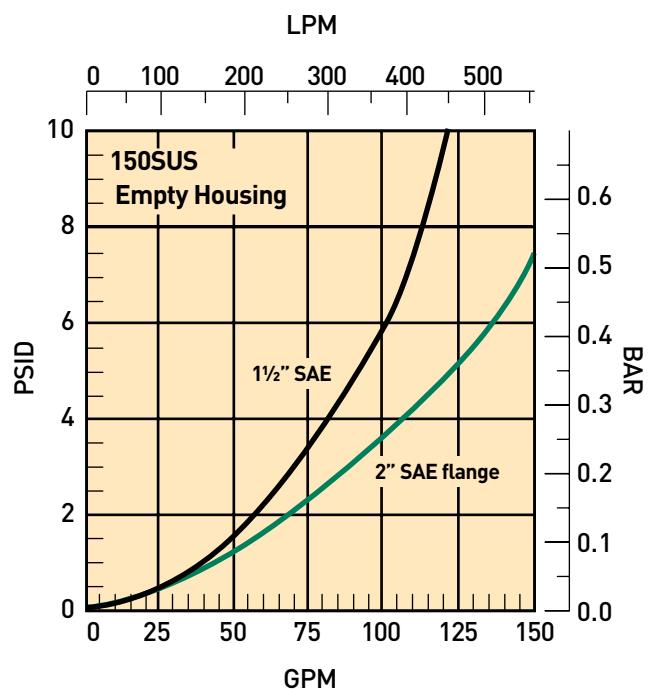

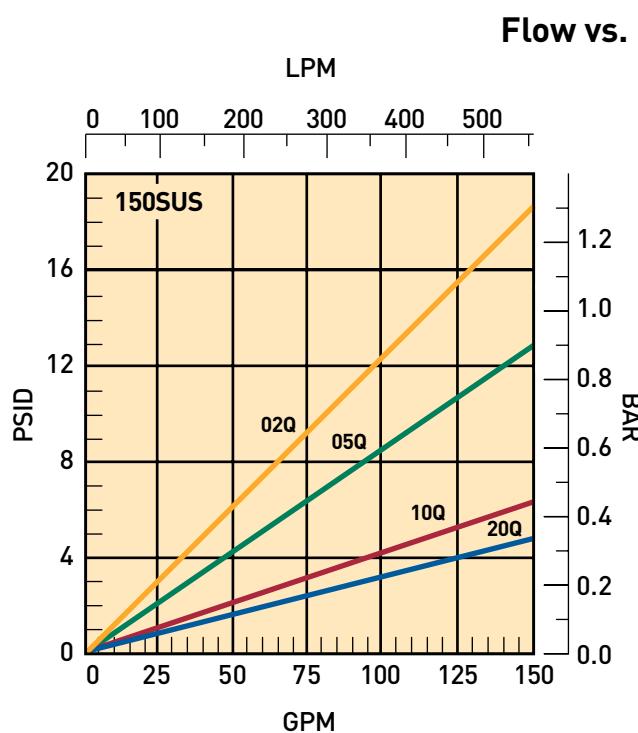

Multipass tests run @ 40 gpm to 50 psid terminal - 5mg/L BUGL

RFP-2 & ILP-2 Element Performance

Multipass tests run @ 80 gpm to 50 psid terminal - 5mg/L BUGL

Low Pressure Filters

Moduflow™ Plus Series

Specifications: RFP, ILP

Pressure Ratings:

Maximum Allowable Operating Pressure (MAOP): 200 psi (13.8 bar)

Design Safety Factor: 2:1

Rated Fatigue Pressure: 150 psi (10.3 bar)

Element Burst Rating: 70 psid (4.8 bar)

Filter Materials:

Head, Cover, Flanges: die cast aluminum
Bowl: steel

Operating Temperatures:

Nitrile: -40°F to 225°F (-40°C to 107°C)

Fluorocarbon: -15°F to 275°F (-26°C to 135°C)

Weight (approximate):

Single: 20 lbs. (9.1 kg)

Double: 25 lbs. (11.3 kg)

Indicators:

Visual (optional)

Electrical (optional) 15A @ 250VAC / .5A @ 125 VDC

Electrical ("D" option) 5A @ 250VAC / 3A @ 28 VDC

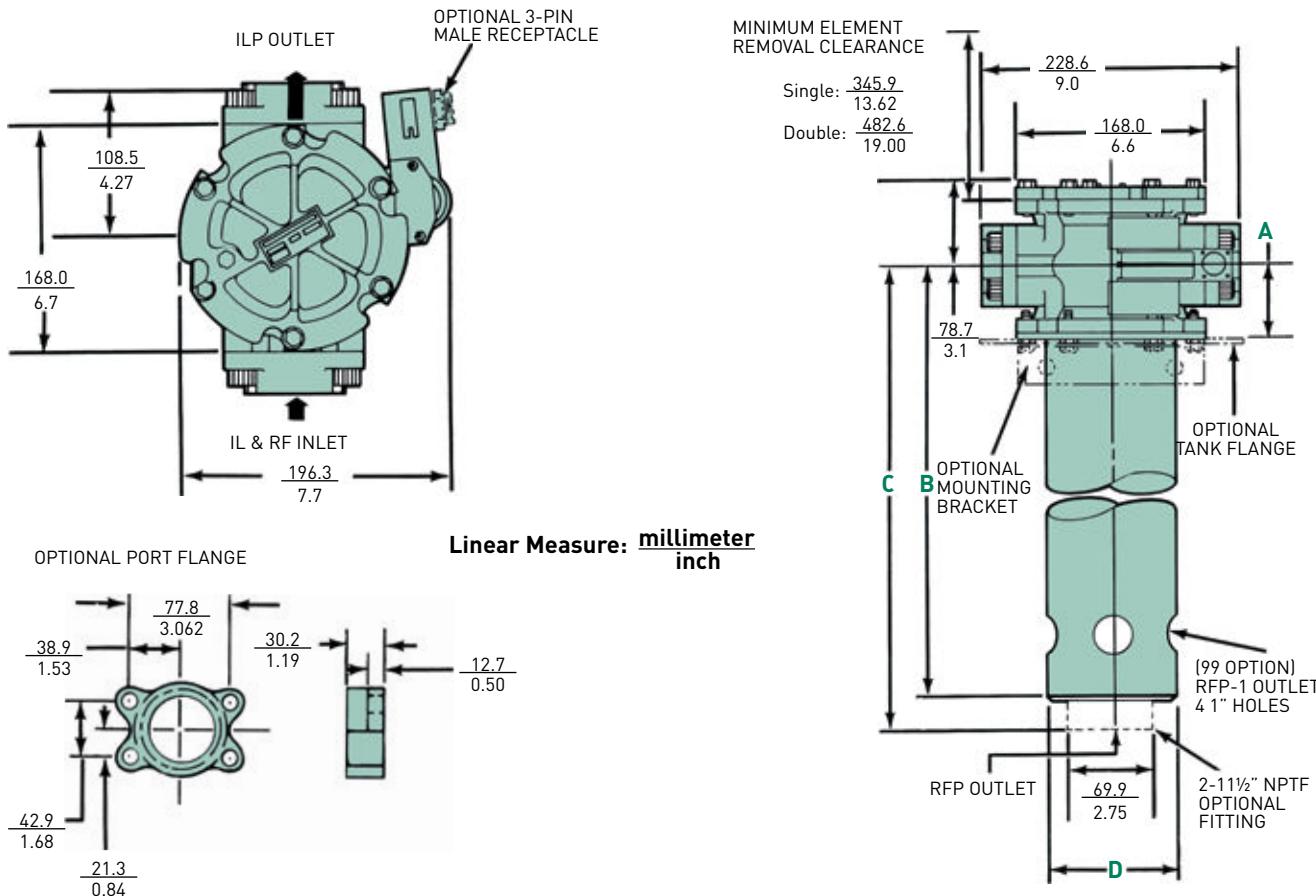

Color Coding:

White (normally closed)

Red (normally open)

Black (common)

HYDAC ISO Cleanliness Levels

ISO 4406 Code

Cleanliness levels are defined by three numbers divided by slashes (/). These numbers correspond to 4, 6, and 14 micron, in that order. Each number refers to an ISO Range Code, which is determined by the number of particles for that size (4,6, & 14 μm) and larger present in 1 ml of fluid. Each range is double the range below. Refer to the chart below to see the actual ranges.

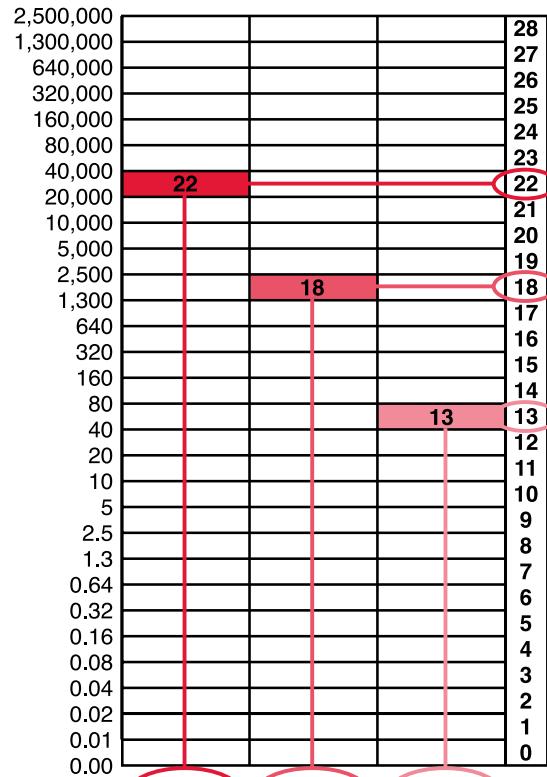

Example:

larger than 4 μm = 22,340

larger than 6 μm = 1,950

larger than 14 μm = 43

ISO Code = 22 / 18 / 13

Achieving the appropriate cleanliness level in a system

The only way to achieve and maintain the appropriate cleanliness level in a hydraulic or lubrication system, is to implement a comprehensive filtration program. HYDAC offers all of the products that are needed to do just that! - They include:

Solid Contamination

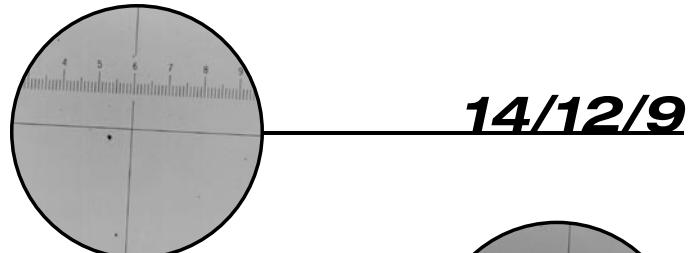

- pressure filters
- return line filters
- offline filtration loops
- oil transfer units for precleaning of new oil
- portable and online contamination monitors
- reservoir breathers and filler/breathers

Water Content

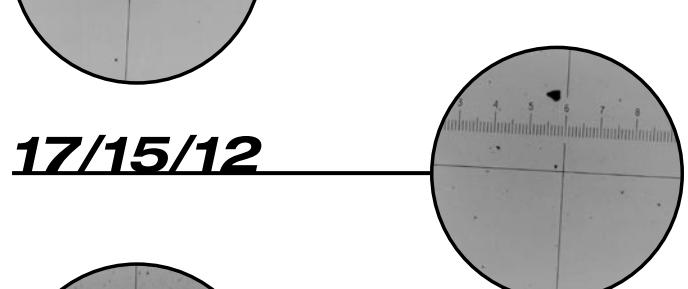

- water content sensors
- reservoir breathers with silica gel desiccant
- vacuum dehydration water removal units
- water removal elements

Fluid Analysis

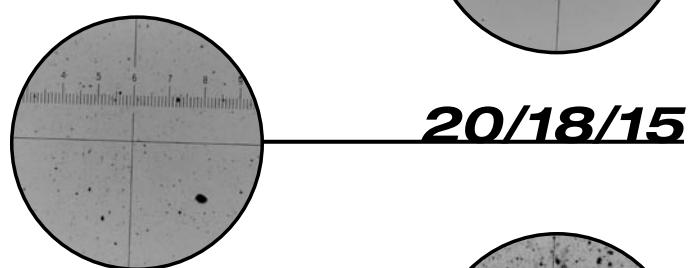

- bottle sampling kits
- complete analysis kits

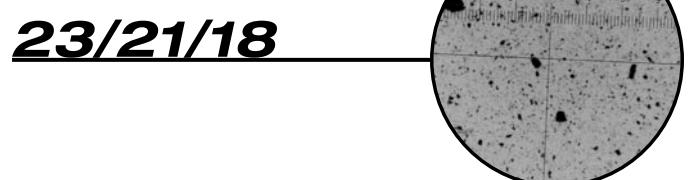

14/12/9

17/15/12

20/18/15

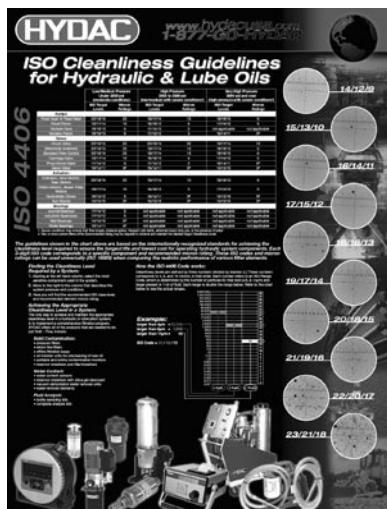

23/21/18

Finding the cleanliness level required by a system

1. Starting at the left hand column, select the most sensitive component used in the system.
2. Move to the right to the column that describes the system pressure and conditions.
3. Here you will find the recommended ISO class level, and recommended element micron rating.

		Low/Medium Pressure Under 2000 psi (moderate conditions)		High Pressure 2000 to 2999 psi (low/medium with severe conditions ¹)		Very High Pressure 3000 psi and over (high pressure with severe conditions ¹)

1. Severe conditions may include high flow surges, pressure spikes, frequent cold starts, extremely heavy duty use, or the presence of water.
2. Two or more system filters of the recommended rating may be required to achieve and maintain the desired Target Cleanliness Level.
